- For acquisition of operation- and fault signals
- Expandable from 3 up to 203 operation- and fault signal inputs
- Width 45 mm

Fault annunciator AD 5999:

- 3 inputs for operation- and fault signals
- Pushbutton connection for acknowledgement of horn and lamp test
- 1 relay for common alarm and 1 for horn

Extension unit AD 5993:

- 4 operation- and fault signal inputs

## Approvals and Markings

The fault annunciator AD 5999 and the extension unit AD 5993 form an expandable fault annunciator system for displaying operating and fault messages.

## Function Diagram

## Circuit Diagrams

## C $\epsilon$

## Application

For monitoring of industrial plants and buildings

## Notes

The connections A1, operation signals B1-B3 and B1-B4, fault signals S1-S3 and S1-S4 and lamp test-inputs LT have to be connected to the same phase.

Also when no common signal output is required the nominal voltage has to be connected to terminal 27 .

The bus-lines H and S have a low voltage and are not allowed to be connected to external voltage (see Connection Example no. 1). If inductive or capacitive superimposed voltages are expected, it is recommened to use screened cables for these lines.

The flash impulse via flash line BS will be generated by an internal contact. The maximum load of this contact must be observed (technical data).

It is not allowed to connect lamps with transformers on the outputs. This would cause unintentional fault signals at the lamp test.

In case of units with AC-voltage, the signal lamps during the lamp test are lighting dim, as the test will be effected only with a half-wave. The half-wave voltage is also applied at terminals B1-B3 and B1-B4 during the lamp test.

If other lamps, except for the fault signal lamps, should be tested via the lamp test push button T1 it is necessary to use a lamp tester whose diode configuration is identically to the diode configuration of the fault annunciator. In case of DC-operation the lamp tester is AI 990 or AI 990.10.
