## Safety Technique

SAFEMASTER C
Multifunction Safety Module
BH 5910

Block Diagram

- According to
- Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508
- Category 4 to EN 954-1
- Functions selectable via rotational switches to connect max.
- 8 E-stop circuits, single channel or
- 4 E-stop circuits, 2-channel or
- 4 light curtains or
- 2 light curtains and 1 E -stop circuit or
- 4 safety gates or
- 2 safety gates and 1 E -stop circuit or
- 4 pairs of 2-hand-buttons or Typ III A according to DIN EN 547 or
- 2 pairs of 2-hand-buttons Typ III C according to DIN EN 547 and 1 E-stop circuit
- In addition selectable:
- auto or manual reset (simulation input for gate monitor)
- continuously monitored feedback circuit to monitor external contactors
- Cross fault detection
- Short circuit and broken wire detection
- Outputs:
- 3 NO or 2 NO and 1 NC contacts
- 2 semiconductor outputs short circuit proof and overload protected
- Under- and overvoltage detection and signalling
- LED indication for operation (RUN), channel $1 / 2$
- 45 mm width

## Approvals and Markings

* see variants

## Applications

- Protection of men and machines

## Indicators

lower green LEDs K1, K2:
On, when relays K 1 and K 2 are energized
upper yellow LEDs run 1, run 2: Continuously on on fault free operation. Regular flashing when waiting for external action e.g. release of an E-stop button. Detected faults are indicated with special flashing sequences (see flash codes for fault indication)
Flashes, als long as starting condition is not fulfilled.

Flashes while waiting for start or simulation input (button). Continuous signal when relay enabled.

## Notes

- On BH 5910.22 the NC contact 31-32 can only be used as monitoring contact.
- Changes of settings are only permitted when supply voltage is disconnected and have to be made by trained persons only.
- Before removing the front cover please touch ground potential.

| Setting |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| The selection of the function of BH 5910 is done via 4 rotational switches behind the front cover of the unit (see drawing on the left). The 2 switches on the left set processor 1 (ch 1) and the 2 switches on the right set processor 2 (ch 2). Both processors must have the same setting. On both upper switches (1) the function is selected, on both lower switches (10) the number of sensor circuits, control and operation mode and the feed back circiuit option is selected. |  |  |  |  |  |  |
| Switch 1 | Function | Switch 1 | No / Sensors | Control mode | Operation mode | Feedback circuit for external contacts |

## Operation Modes

- Auto start
(with function E-stop and light curtain)
On automatic restart the output contacts are activated when the input condition for the selected function is fulfilled.
A start-button is only necessary in 2 cases:
- If the function light curtain, safety gate or 2-hand-safety is combined with E-stop.
- If a function with feedback circuit is selected and the unit has to be reset after a detected fault without disconnection.
- Manual start
(with function E-stop and light curtain)
If the unit was deactivated by operating the safety function e.g. by pressing an e-stop button it only can be reset in manual mode by pressing the start button. After voltage failure the unit has to be reset also with the start button. The button has to be pressed not longer then 3 sec . to allow the unit to energise.

If one of the functions light curtain, safety gate or 2-hand-safety is combined with E-stop the E-stop function always works with manual restart.

When manual start is selected, the start button is always connected to terminals S43-S44.

If the number of contacts has to be increased or a higher current has to be switched by contactors a feedback circuit with NC contactors can be connected to terminals S41-S42 (see drawing 1). This circuit allows to monitor the state of the external contactors. The BH 5910 monitors continuously if the state of this input corresponds to the state of K1 and K2.
In the case of a fault K1 and K2 switch off or do not switch on at all. If the fault is removed, the BH 5910 has to be reset with the start button.

When operating the unit with feedback circuit the circuit has to be connected to terminal S41 and S42.

Pic. 1: E-stop, 2-channel, with 3 E-stop buttons, manual start and 2 external contactors with feed back circuits (Switch 1: position 0, switch 10: position 4 or 5)

## E-Stop (switch 1 in position 0)

With switch 10 the maximum number of e-stop loops is selected. Open (unused) inputs (S_1/S_2 and S_3/S_4) have to be linked with a wire bridge. K1 and K2 can only be activated, if all e-stop buttons are released. The function diagrams show only the action of one e-stop button. We pretend that the others are closed.
When the unit is used with 2-channel e-stop loops, it checks the state of the inputs. If both channels have different signals for more then 50 ms the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

## Function Diagrams

## Semiconductor outputs

| Output | Flashing signal | Continuous signal |
| :---: | :---: | :---: |
| 48 | E-stop active or <br> failure in feedback circuit or <br> failure on start button |  |
| 58 | Wait for start button | Relay K1, K2 active |

## Application Example

Pic. 2: E-stop, 2-channel, with 4 e-stop loops, auto start (switch 1 in position 0 , switch 10 in position 0 )

Pic. 3: E-stop, 1-channel, with 8 e-stop loops, auto start; (switch 1 in position 0, switch 10 in position 2)

Pic. 4: E-stop, 2-channel, with 2 e-stop loops, manual start; (switch 1 in position 0; switch 10 in position 1)

## Light Curtains (switch 1 in position 1)

With switch 10 the maximum number of LCs (Light curtains) is selected. Open (unused) inputs (S_1/S_2 and S_3/S_4) have to be linked with a wire bridge.
K1 and K2 can only be activated, if no LC is interrupted.
If both channels of an LC have different signals for more then 50 ms the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply. The BH 5910 can be used on LCs of type 4 (IEC/EN 61 496-1) or type 2 with self test and crossfault monitoring.
The following function diagrams show the function of one LC. We pretend that other connected LCs are not interrupted.

## Function Diagrams

Light curtains, auto start

## Settings on switch 10

| Switch <br> 10 | No. of <br> LCs | Type of <br> control | Type of <br> start | Feedback circuit for <br> external contactors |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 4 | 2-channel light curtains | Auto-Start | no |
| 1 | 3 | 2-channel light curtains | Manual start | no |
| 2 | 3 | 2-channel light curtains | Auto-Start | yes |
| 3 | 3 | 2-channel light curtains | Manual start | yes |
| $4-9$ | position not allowed (failure 5) |  |  |  |

## Terminal designation

| Terminal | Light curtains |  | Feedback circuit and /or manual start |
| :---: | :---: | :---: | :---: |
| S11 | not connected | link S11-S12 |  |
| S12 | LC 1 | without LCl 1 |  |
| S13 | not connected | link S13-S14 |  |
| S14 | LC 1 | without LC 1 |  |
| S21 | not connected | link S21-S22 |  |

## Application Example

Pic. 5: Light curtains, with 4 LCs, auto start; (switch 1 in position 1, switch 10 in position 0)

Light Curtains (switch 1 in position 1); Application Example

Pic. 6: Light curtains, with 2 LCs, manual start; (switch 1 in position 1, switch 10 in position 1)

## Light Curtains and E-Stop (switch 1 in position 2)e

In this function the unit is always set to 2 LCs and 1 e-stop loop. Open (unused) inputs (S21/S22 and S23/S24) have to be linked with a wire bridge. K1 and K2 can only be activated, if no LC is interrupted and the e-stop loop is closed.
After an e-stop or power failure the unit has to be reset with manual start. If both channels of an LC or e-stop loop have different signals for more then 50 ms the outputs K1 and K2 are switched off and the unit gives failure code 7 . This failure is stored and can only be reset by disconnecting the auxiliary supply.

## Settings on switch 10

| Switch <br> 10 | No. of <br> LCs | Type of <br> control | Type of <br> start | Feedback circuit for <br> external contactors |

Light curtains and E-stop, auto start

Light curtains and E-stop, manual start

Pic. 7: Light curtains and E-stop, auto start or manual start (switch 1 in position 2, switch 10 in position 0 or 1)

## Safety Gates (switch 1 in position 3)

With switch 10 the maximum number of gates is selected. Open (unused) inputs (S_1/S_2 and S_3/S_4) have to be linked with a wire bridge. If gate inputs are not used the type of control has to be with simulation button. K1 and K2 can only be activated, if all connected gates have been opened and closed again. Both gate contacts have to be operated within 3 s . If the time difference is longer, the gate has to be opened before it can be closed again. When all gates are closed the unit can also be activated by an external connected Simulation button.
If changeover contacts are used on the gate switches the switchover time has to be less then 50 ms . If it is longer the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

## Function Diagram

Gate monitor, 2 gates with 3 NO contacts for each gate, Simulation button

## Semiconductor outputs

| Output | Flashing signal | Continuous signal |
| :---: | :---: | :---: |
| 48 | Open gate or failure in feedback <br> circuit or in start circuit |  |
| 58 | Gates are closed but starting <br> conditions not fulfilled | Gates are closed and <br> contacts K1, K2 <br> are active |

Settings on switch 10

| Switch <br> 10 | Number <br> of gates | Number and <br> type of <br> gate switches | Simulation <br> button | Feedback circuit <br> for external <br> contactors |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 4 | 2 NO contacts | no | no |
| 1 | 3 | 2 NO contacts | yes | no |
| 2 | 2 | 2 C/O contacts | no | no |
| 3 | 1 | 2 C/O contacts | yes | no |
| 4 | 2 | 3 NO contacts | yes | no |
| 5 | 1 | 2 C/O contacts <br> + 1 NO contact | yes | no |
| 6 | 3 | 2 NO contacts | yes | yes |

Pic. 11: Gate monitor, 1 gate with 2 changeover gate contacts, simulation button (switch 1 in position 3 ; switch 10 in position 5 )

## Safety Gates and E-Stop (switch 1 in position 4)

With switch 10 the maximum number of gates is selected. Open (unused) inputs (S_1/S_2 and S_3/S_4) have to be linked with a wire bridge.
K1 and K2 can only be activated, if the e-stop loop is closed and all connected gates have been opened and closed again.
Both gate contacts have to be operated within 3 s . If the time difference is longer, the gate has to be opened before it can be closed again. When all gates are closed the unit can also be activated by an external connected simulation button.
After e-stop or power failure the unit can only be reset by manual start.
If changeover contacts are used on the gate switches the switchover time has to be less then 50 ms . If it is longer the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

| 58 | Gates are closed but starting <br> conditions not fulfilled or E-stop <br> loop has been opened and closed <br> again. <br> K1, K2 can be activated with the <br> simulation button | Gates are closed and <br> contacts K1, K2 are <br> active |

Pic. 12: Gate monitor and E-stop, 1 gate with 3 NO gate contacts and 1 e-stop loop (switch 1 position 4; switch 10 position 2)

Pic. 13: Gate monitor and E-stop, safety gate monitoring with up to 20 magnetic coded safety switches NE $5021+1$ e-stop loop (switch 1 position 4 ; switch 10 position 0 or 3)

## Two-Hand Control (switch 1 in position 5)

4 pairs of 2-hand buttons Typ III A or 2 pairs of 2-hand buttons Typ III C according to DIN EN 574 can be connected in this function. The number of connected button pairs has to be selected on the device. K1 and K2 can only be activated, if 3 conditions are fulfilled:

- First all button pairs have to be in initial position.
- Both buttons of 1 pair have to be pressed within 0.5 sec .
- All connected pairs have to be operated within 15 s .

If changeover contacts are used in the 2-hand buttons the switchover time has to be less then 50 ms . If it is longer the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

## Function Diagram

Two-hand control, 2 pairs of buttons with 2 NO contacts each

## Set-Up Instructions

The device has to be connected as shown in the application examples. When connecting the push-buttons in parallel or in series the safe function of the relay is disabled. The buttons must be designed and installed in a way, that it is not possible to manipulate or to operate them without intention.

The distance between push buttons and dangerous area must be chosen in a way that it is not possible to reach the dangerous area after release of one button before the dangerous movement comes to standstill.

The safety distance " S " is calculated with the following formula:
$\mathrm{S}=\mathrm{V} x \mathrm{~T}+\mathrm{C}$
a) moving speed of person $V=1600 \mathrm{~mm} / \mathrm{s}$
b) stopping time of the machine T (s)
c) Additional safety distance $\mathrm{C}=250 \mathrm{~mm}$

If the risc of accessing the dangerous area is prohibited while the push buttons are pressed e.g. by covering the buttons, $C$ can be 0 . The minimum distance has to be in this case 100 mm . See also EN 574.

## Settings on switch 10

Pic.15: 2-hand control, with 2 pairs of buttons and 2 changeover contacts each (switch 1 in position 5; switch 10 in position 5 ) Safety switches Typ III C according to DIN EN 574

## Two-Hand Control and E-Stop (switch 1 in position 6)

2 pairs of 2-hand buttons can be connected in this function together with 1 e-stop loop. The number of connected button pairs has to be selected on the device.
K1 and K2 can only be activated, if 4 conditions are fulfilled:

- First all button pairs have to be in initial position.
- The e-stop contacts must be closed and manual start must be activated
- Both buttons of 1 pair have to be pressed within 0.5 sec .
- All connected pairs have to be operated within 15 sec .

If changeover contacts are used in the 2-hand buttons the switchover time has to be less then 50 ms . If it is longer the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.
After e-stop or power failure the start button must always be activated. The e-stop loop must be closed and all 2-hand button pairs must be in initial position.

- Width:

45 mm

## Ordering Example

## Variant

BH 5910/61:
with UL-approval

safe breaking, no continuous arcing under the curve, max. 1 switching cycle/s

Limit curve for arc-free operation

## Fault Indication by flashing code

The failure codes are displayed by a flashing sequence of the upper yellow LEDs run 1, run 2. Flashing frequence: env. $0,5 \mathrm{~s}$ on, $0,05 \mathrm{~s}$ off, end od the sequence: env. 2 s off. It is possible that the two processors show different failure codes.
If a failure is displayed, the relays K1 and K2 are switched off.
These failures are serious and do not allow further operation of the module. They are indicated only by the LEDs run 1 and / or run 2 of the module. The semiconductor outputs 48 and 58 are both switched off. The module can only be reset by switching the power supply off and on again.

| $\mathrm{N}^{* *}$ | Description | Mesures et conseils |
| :---: | :---: | :---: |
| 0 | Internal module failure (LEDs are continuously off) | If both LEDs stay off, the module is defective and has to be repaired. |
| 5 | Adjustment failure | 1) The settings of the 2 channels are not identically. <br> 2) The selected setting is not permitted. |
| 6 | Undervoltage detection ou Overvoltage detection | 1) Left LED is flashing: <br> The supply voltage dropped below the permitted value (< approx.0.85 $U_{N}$ ) <br> 2) Right LED is flashing: The supply voltage went over the permitted value (> approx.1.15 $U_{N}+5 \%$ residual ripple) |
| 7 | Input failure | 1) A short circuit has been detected on the inputs of the unit. <br> 2) The 2 signals of a 2-channel sensor (E-stop button, light curtain) are not identical. (Short circuit, broken wire, other defects). |
| 8 | Failure on relays K 1 or K2 | Check circuit and current. Module has to be repaired. |
| $\begin{aligned} & 9 \\ & 10 \\ & 11 \end{aligned}$ | Internal module failure | Please try to evaluate the circumstances that lead to this 10 fault and check with the supplier or manufacturer. |
| $12$ <br> 13 <br> 14 | Internal module failure | The module has to be repaired |

*) No.: Number of flash pulses in a series
