

# RGS1P..AA.., RGS1P..V..

## 1-pole proportional switching controllers

### Description

The RGS1P is a series of solid state relays that give the possibility to control output power of 1-phase loads with an analog control input. The RGS1P is intended to be mounted on chassis or an external heatsink.

Input types cover a wide range of current and voltage ranges. Local setting by an external potentiometer is possible. Switching modes, selectable through a front knob, allow phase angle control, full cycle control, advanced full cycle control specific for short wave infrared heaters and soft starting for limiting inrush current of loads having a high temperature coefficient.

The output of the RGS1P is protected against overvoltages by means of an integrated varistor across the output. Two front LEDs indicate the status of the load and control.

Specifications are at a surrounding temperature of 25°C unless otherwise specified.

### Benefits

- **Eliminates the need for analog to digital converters.** The output of the RGS1P can be controlled directly via an analog current or analog voltage signal.
- **Inventory reduction.** Multifunction controller with the possibility to select amongst a number of switching modes.
- **Less maintenance costs.** Wire bonding technology reduces thermal and mechanical stresses of the output chips resulting in a larger number of operational cycles compared to other assembly technologies.
- **Low machine downtime.** Integrated overvoltage protection prevents the solid state relay from breaking down due to uncontrolled transients that may occur on the lines.
- **Fast wiring.** Power connections for models rated at 90 A are equipped with terminals that can handle cables up to 25 mm<sup>2</sup> / AWG3 cables.
- **Accommodates UL508A requirements for Industrial Control Panels.** All models carry a 100 kArms Short Circuit Current Rating.

### Applications

Injection moulding, PET stretch blow moulding, thermoforming, electrical ovens, furnaces, climatic chambers, duct heating, air handling units.

### Main features

- 1-pole analog switching AC solid state relays
- Selectable switching mode: phase angle, distributed full cycle(s), advanced full cycle, soft starting
- Ratings up to 660 VAC and 90 AAC
- Control inputs: 4-20 mA or 0-5 V, 1-5 V, 0-10 V, external potentiometer

|---|--|
| <b>Radio interference field emission (radiated)</b>     | EN/IEC 55011<br>Class A: from 30 to 1000 MHz   |
| <b>Radio interference voltage emissions (conducted)</b> | EN/IEC 55011<br>Class A: from 0.15 to 30 MHz<br>(External filter may be required - refer to Filtering section) |

- Control input lines must be installed together to maintain products' susceptibility to Radio Frequency interference.
- Use of AC Solid State Relays may, according to the application and the load current, cause conducted radio interferences. Use of mains filters may be necessary for cases where the user must meet E.M.C requirements. The capacitor values given inside the filtering specification tables should be taken only as indications, the filter attenuation will depend on the final application.
- Surge tests on RG..A were carried out with the signal line impedance network. In case the line impedance is less than 40Ω, it is suggested that AC supply is provided through a secondary circuit where the short circuit limit between conductors and ground is 1500VA or less.
- A deviation of one step in the distributed full cycle models and up to 1.5% Full Scale Deviation in phase angle models is considered to be within PC1 criteria.
- Performance Criteria 1 (PC1): No degradation of performance or loss of function is allowed when the product is operated as intended.
- Performance Criteria 2 (PC2): During the test, degradation of performance or partial loss of function is allowed. However when the test is complete the product should return operating as intended by itself.
- Performance Criteria 3 (PC3): Temporary loss of function is allowed, provided the function can be restored by manual operation of the controls.

Note: The suggested filtering is determined by tests carried out on a representative setup and load. The RGS1P.. is intended to be integrated within a system where conditions may differentiate from conditions utilised for tests, such as load, cable lengths and other auxiliary components that may exist within the end system. It shall be the responsibility of the system integrator to ensure that the system containing the above component complies with the applicable rules and regulations.

Filter manufacturer installation recommendations shall be taken in consideration when utilising such filters.

### Filter connection diagram

X: 此零件某种材料中含有的该有害物高于GB/T 26572的限定。

## Switching modes

### MODE 1: Phase angle switching

The Phase angle switching mode works in accordance with the phase angle control principle. The power delivered to the load is controlled by the firing of the thyristors over each half supply cycle. The firing angle varies in relation to the input signal level which determines the output power to be delivered to the load.

### Full cycle switching:

In Full cycle switching modes only full cycles are being switched. Switching at zero voltage reduces EMC interference as compared to phase angle switching (mode 1). The ON full cycles are distributed over a specific time base. Compared to burst firing, this enables faster and more accurate control of the load in addition to extending the heater lifetime. This mode is suitable for use only with resistive loads.

### MODE 2: 1x Full cycle switching

This mode offers the lowest resolution for full cycle switching, i.e., 1 full cycle. At 50% output power demand the SSR will switch ON the load for 1 full cycle and OFF for 1 full cycle in a repeated pattern. Below 50% output power demand, the non-firing period increases but the firing period remains fixed at 1 full cycle. Over 50% output power demand, the firing period increases but the non-firing period remains fixed at 1 full cycle.

Hence at 25% output power demand, the non-firing period gets longer and the SSR will switch ON the load for 1 full cycle and OFF for 3 full cycles in a repeated pattern. At 75% output power demand, the firing period is longer and the SSR will switch ON the load for 3 full cycles and OFF for 1 full cycle in a repeated pattern. At 100% output power demand, the SSR switches the load fully ON.

## Switching modes

### MODE 3: 4x Full cycle switching

### MODE 4: 16x Full cycle switching

In mode 3 the minimum resolution is 4 full cycles. At 50% output power demand the SSR will switch ON the load for 4 full cycles and OFF for 4 full cycles in a repeated pattern. Below 50% output power demand, the non-firing period increases but the firing period remains fixed at 4 full cycles. Over 50% output power demand, the firing period increases but the non-firing period remains fixed at 4 full cycles.

In mode 4 the minimum resolution is 16 full cycles. At 50% output power demand the SSR will switch ON the load for 16 full cycles and OFF for 16 full cycles in a repeated pattern. Below 50% output power demand, the non-firing period increase but the firing period remains fixed at 16 full cycles. Over 50% output power demand the firing period increases but the non-firing period remains fixed at 16 full cycles.

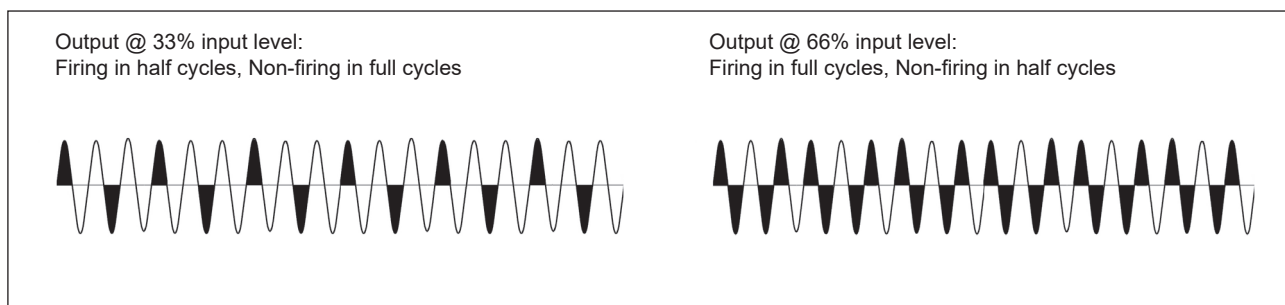

### MODE 5: Advanced Full Cycle (AFC) switching

This switching mode is based on the principle of distributed full cycle explained above with the difference that the resolution for firing and nonfiring periods is changed to a half mains cycle. This mode is intended for use with short / medium wave infrared heaters. The purpose of the half cycle non-firing time is to reduce the annoying visual flickering of such lamp loads.

Below 50% output power demand, the SSR switches ON the load in half cycle periods. The non-firing periods are full cycles.

Above 50% output power demand, the SSR switches ON the load in full cycle periods but the non-firing periods are half cycles.

### SOFT STARTING

Soft starting is utilised to reduce the start-up current of loads having a high cold to hot resistance ratio such as short wave infrared heaters. The thyristor firing angle is gradually increased over a time period of maximum 5 seconds (settable through an accessible potentiometer) in order to apply the voltage (and current) to the load smoothly.

Soft starting is performed on the first power up and in cases of non firing periods exceeding 5 seconds. If soft start is stopped before soft start completion, it is assumed that a start was performed and the non firing period count start as soon as the soft start is stopped.

**Switching modes**

**MODE 6: Soft start + MODE 4 (16x full cycle switching)**

This switching mode works on the principle of switching mode 4 (16x full cycles) but soft starting is performed on power up or in case of the non firing periods exceeding 5 seconds. After the soft start is completed, full cycles (with a resolution of 16 full cycles) are delivered to the load according to the input signal, based on MODE 4 switching principle.

**MODE 7: Soft start + MODE 5 (Advanced full cycle switching)**

This switching mode works on the principle of the advanced full cycle (mode 5) but soft starting is performed on power up or in case of the non firing periods exceeding 5 seconds. After the soft start is completed, output power is delivered to the load according to the input signal, based on Mode 5 switching principle.

**LED indicators**

**RGS1P..AA..**

| LED             | Status             | Timing Diagram   |
|-----------------|--------------------|------------------|
| CONTROL (green) | Control input <4mA | [Pulse]          |
|                 | Control input >4mA | [Pulse]          |
|                 | Mains loss         | [Pulse] 0.5s     |
|                 | SSR internal error | [Pulse] 0.5s, 3s |
| LOAD (yellow)   | LOAD ON            | [Pulse]          |

**RGS1P..V..**

## Short circuit protection

### Protection Co-ordination, Type 1 vs Type 2:

Type 1 protection implies that after a short circuit, the device under test will no longer be in a functioning state. In type 2 co-ordination the device under test will still be functional after the short circuit. In both cases, however, the short circuit has to be interrupted. The fuse between enclosure and supply shall not open. The door or cover of the enclosure shall not be blown open. There shall be no damage to conductors or terminals and the conductors shall not separate from terminals. There shall be no breakage or cracking of insulating bases to the extent that the integrity of the mounting of live parts is impaired. Discharge of parts or any risk of fire shall not occur.

The product variants listed in the table hereunder are suitable for use on a circuit capable of delivering not more than 100,000 A Symmetrical Amperes, 600 Volts maximum when protected by fuses. Tests at 100,000 Arms were performed with Class J fuses, fast acting; please refer to the tables below for maximum ratings. Tests with Class J fuses are representative of Class CC fuses.

| Protection co-ordination Type 1 according to UL 508 |   |                   |         |               |
|---|---|-------------------|---------|---------------|
| Part No.  | Prospective short circuit current [kArms] | Max fuse size [A] | Class   | Voltage [VAC] |

9. Between MCB and Load (including return path which goes back to the mains)

Note: A prospective current of 6 kA and a 230 / 400 V power supply is assumed for the above suggested specifications. For cables with different cross section than those mentioned above please consult Carlo Gavazzi's Technical Support Group.

S201 models refer to 1-pole M.C.B., S202 models refer to 2-poles M.C.B.

## Dimensions

### RGS1P..50..

### RGS1P..92..

Housing width tolerance +0.5 mm, -0 mm as per DIN 43880. All other tolerances +/- 0.5 mm. Dimensions in mm.

Note: The indicated depth dimension of the RGx1P has to be increased by 3 mm when the tamper proof cover accessory is mounted on the device.

Terminal interface

RGS1P..AA..

**Terminals labelling:**

- 1/L1: Line connection
- 2/T1: Load connection
- A1 - A2: Control input: 4 - 20 mA

RGS1P..V..

**Terminals labelling:**

- 1/L1: Line connection
- 2/T1: Load connection
- A1-GND: Control input: 0-10 V
- A2-GND: Control input: 0-5 V
- A3-GND: Control input: 1-5 V
- POT: External potentiometer input
- Us (+, ~): External supply, positive signal (RG..V..D) or AC signal (RG..V..A)
- Us (-, ~): External supply, ground (RG..V..D) or AC signal (RG..V..A)

Ramp up time setting for soft starting, applicable for Modes 6 and 7 only

| Mode Selection  | Switching mode                     |
|---|------------------------------------|
|  | 1 Phase angle (default setting)    |
|   | 2 1x full cycle                    |
|   | 3 4x full cycles                   |
|   | 4 16x full cycles                  |
|   | 5 Advanced full cycle              |
|   | 6 Soft start + 16x full cycles     |
|   | 7 Soft start + advanced full cycle |
